DATE MAILED: 07/09/2003

Please find below and/or attached an Office communication concerning this application or proceeding.

# Office Action Summary

Application No.  
09/132,157

Applicant(s)  
FORBES

Examiner  
Prenty

Art Unit  
2822

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

## Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE three MONTH(S) FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136 (a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If the period for reply specified above is less than thirty (30) days, a reply within the statutory minimum of thirty (30) days will be considered timely.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133).
- Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

## Status

- 1) ☒ Responsive to communication(s) filed on Apr 14, 2003.
- 2a) ☐ This action is **FINAL**. 2b) ☒ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11; 453 O.G. 213.

## Disposition of Claims

- 4) ☒ Claim(s) 11, 13, 14, 24-28, 32, and 38-43 is/are pending in the application.
- 4a) Of the above, claim(s) \_\_\_\_\_ is/are withdrawn from consideration.
- 5) ☐ Claim(s) \_\_\_\_\_ is/are allowed.
- 6) ☒ Claim(s) 11, 13, 14, 24-28, 32, and 38-43 is/are rejected.
- 7) ☐ Claim(s) \_\_\_\_\_ is/are objected to.
- 8) ☐ Claims \_\_\_\_\_ are subject to restriction and/or election requirement.

## Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☐ The drawing(s) filed on \_\_\_\_\_ is/are a) ☐ accepted or b) ☐ objected to by the Examiner.  
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
- 11) ☐ The proposed drawing correction filed on \_\_\_\_\_ is: a) ☐ approved b) ☐ disapproved by the Examiner.  
If approved, corrected drawings are required in reply to this Office action.
- 12) ☐ The oath or declaration is objected to by the Examiner.

## Priority under 35 U.S.C. §§ 119 and 120

- 13) ☐ Acknowledgement is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).  
a) ☐ All b) ☐ Some\* c) ☐ None of:  
1. ☐ Certified copies of the priority documents have been received.  
2. ☐ Certified copies of the priority documents have been received in Application No. \_\_\_\_\_.  
3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).  
\*See the attached detailed Office action for a list of the certified copies not received.
- 14) ☐ Acknowledgement is made of a claim for domestic priority under 35 U.S.C. § 119(e).  
a) ☐ The translation of the foreign language provisional application has been received.
- 15) ☐ Acknowledgement is made of a claim for domestic priority under 35 U.S.C. §§ 120 and/or 121.

## Attachment(s)

- 1) ☒ Notice of References Cited (PTO-892) 4) ☐ Interview Summary (PTO-413) Paper No(s). \_\_\_\_\_
- 2) ☐ Notice of Draftsperson's Patent Drawing Review (PTO-948) 5) ☐ Notice of Informal Patent Application (PTO-152)
- 3) ☐ Information Disclosure Statement(s) (PTO-1449) Paper No(s). \_\_\_\_\_ 6) ☐ Other:

This non-final Office Action is in response to the response filed April 14, 2003. This Office Action is non-final because the §102/§103 rejections have been restated in order to improve the record. Specifically, the passages citing the Chan et al. evidence have been restated so as to directly and fully quote the pertinent Chan et al. disclosure relied upon.

As a preliminary matter, the applicant has failed to meet the burden clearly set forth in the Office Action mailed January 9, 2003 (i.e., its burden to come forward with **evidence** establishing an unobvious difference between the claimed product and the prior art products. See MPEP §2113. Again, **mere attorney argument cannot take the place of evidence**. See *In re DeBlauwe*, 736 F.2d 699, 222 USPQ 191 (Fed. Cir. 1984).

Product-by-process claims 11, 14, 24, 25, 28, 32, 38, 40 and 41 are rejected under 35 U.S.C. §102(b) as anticipated by or, in the alternative, under 35 U.S.C. §103(a) as obvious over Selvakumar et al. (United States Patent 5,426,069, already of record). Note MPEP §2113.

With respect to independent claim 11, Selvakumar et al. disclose a p-channel metal-oxide-semiconductor (MOS) transistor, comprising (see the entire patent, particularly column 1, line 51, and the Figs. 1-7 disclosure): a silicon substrate; a silicon dioxide (SiO<sub>2</sub>) gate oxide, coupled to the substrate; a gate, coupled to the SiO<sub>2</sub> gate oxide; source/drain regions formed in the substrate on opposite sides of the gate; and a Si<sub>1-x</sub>Ge<sub>x</sub> channel region, having a germanium molar fraction x, located underneath the SiO<sub>2</sub> gate oxide and between the source/drain regions, wherein x is less than or equal to 0.6, and wherein the Si<sub>1-x</sub>Ge<sub>x</sub> channel region forms a continuous Si<sub>1-x</sub>Ge<sub>x</sub>/SiO<sub>2</sub> gate oxide interface wherein no germanium oxide is present at the

$\text{Si}_{1-x}\text{Ge}_x/\text{SiO}_2$  gate oxide interface (see Fig. 7, as well as column 4, lines 18-19, and column 5, lines 10-11). See also Chan et al. (United States Patent 5,801,396, already of record), which discloses: "SiGe alloys at low Ge concentrations provide grown oxides which are reasonably close in quality to those grown on pure Si" (column 7, lines 16-18), and note that Selvakumar et al's SiGe channel region has a low (about 16%) Ge concentration.

Thus, although claim 11's transistor is formed by a different process than Selvakumar et al's transistor (i.e., claim 11's SiGe channel region is formed by implanting germanium into the silicon substrate after the  $\text{SiO}_2$  gate oxide is formed while Selvakumar et al's SiGe channel region is formed by implanting germanium into the silicon substrate before the  $\text{SiO}_2$  gate oxide is formed), claim 11's transistor, including its "wherein the  $\text{Si}_{1-x}\text{Ge}_x$  channel region forms a continuous  $\text{Si}_{1-x}\text{Ge}_x/\text{SiO}_2$  gate oxide interface wherein no germanium oxide is present at the  $\text{Si}_{1-x}\text{Ge}_x/\text{SiO}_2$  gate oxide interface" limitation, is the same as or obvious over Selvakumar et al's transistor, as evidenced by both Selvakumar et al. (see Fig. 7, as well as column 4, lines 18-19, and column 5, lines 10-11) and Chan et al. (which discloses "SiGe alloys at low Ge concentrations provide grown oxides which are reasonably close in quality to those grown on pure Si" (column 7, lines 16-18)).

Accordingly, as per MPEP §2113, claim 11 is rejected under 35 U.S.C. §102(b) as anticipated by or, in the alternative, under 35 U.S.C. §103(a) as obvious over Selvakumar et al.

With respect to dependent claim 14, Selvakumar et al's germanium molar fraction is approximately 0.2. See column 3, lines 58-61.

Claim 14 is thus rejected under 35 U.S.C. §102(b) as anticipated by or, in the

alternative, under 35 U.S.C. §103(a) as obvious over Selvakumar et al.

With respect to independent claim 24, Selvakumar et al. disclose a p-channel metal-oxide-semiconductor (MOS) transistor formed on a silicon substrate, comprising (see the entire patent, particularly column 1, line 51, and the Figs. 1-7 disclosure): a  $\text{Si}_{1-x}\text{Ge}_x$  channel region, having a germanium molar fraction of  $x$ , and formed in the substrate, underneath a silicon dioxide ( $\text{SiO}_2$ ) gate oxide and between a source region and a drain region; wherein  $x$  is less than or equal to 0.6, and wherein the  $\text{Si}_{1-x}\text{Ge}_x$  channel region forms a continuous  $\text{Si}_{1-x}\text{Ge}_x/\text{SiO}_2$  gate oxide interface wherein no germanium oxide is present at the  $\text{Si}_{1-x}\text{Ge}_x/\text{SiO}_2$  gate oxide interface (see Fig. 7, as well as column 4, lines 18-19, and column 5, lines 10-11). See also Chan et al. (United States Patent 5,801,396, already of record), which discloses: "SiGe alloys at low Ge concentrations provide grown oxides which are reasonably close in quality to those grown on pure Si" (column 7, lines 16-18), and note that Selvakumar et al's SiGe channel region has a low (about 16%) Ge concentration.

Thus, although claim 24's transistor is formed by a different process than Selvakumar et al's transistor (i.e., claim 24's SiGe channel region is formed by implanting germanium into the silicon substrate after the  $\text{SiO}_2$  gate oxide is formed while Selvakumar et al's SiGe channel region is formed by implanting germanium into the silicon substrate before the  $\text{SiO}_2$  gate oxide is formed), claim 24's transistor, including its "wherein the  $\text{Si}_{1-x}\text{Ge}_x$  channel region forms a continuous  $\text{Si}_{1-x}\text{Ge}_x/\text{SiO}_2$  gate oxide interface wherein no germanium oxide is present at the  $\text{Si}_{1-x}\text{Ge}_x/\text{SiO}_2$  gate oxide interface" limitation, is the same as or obvious over Selvakumar et al's transistor, as evidenced by both Selvakumar et al. (see Fig. 7, as well as column 4, lines 18-19, and column 5, lines 10-11) and Chan et al. (which discloses "SiGe alloys at low Ge

concentrations provide grown oxides which are reasonably close in quality to those grown on pure Si" (column 7, lines 16-18)).

Accordingly, as per MPEP §2113, claim 24 is rejected under 35 U.S.C. §102(b) as anticipated by or, in the alternative, under 35 U.S.C. §103(a) as obvious over Selvakumar et al.

With respect to independent claim 25, Selvakumar et al. disclose a p-channel metal-oxide-semiconductor (MOS) transistor formed on a silicon substrate, comprising (see the entire patent, particularly column 1, line 51, and the Figs. 1-7 disclosure): a  $\text{Si}_{1-x}\text{Ge}_x$  channel region, having a germanium molar fraction of  $x$ , and formed in the substrate, underneath a silicon dioxide ( $\text{SiO}_2$ ) gate oxide and between a source region and a drain region; wherein  $x$  is less than or equal to 0.6, and wherein the  $\text{Si}_{1-x}\text{Ge}_x$  channel region forms a continuous  $\text{Si}_{1-x}\text{Ge}_x/\text{SiO}_2$  gate oxide interface wherein no germanium oxide is present at the  $\text{Si}_{1-x}\text{Ge}_x/\text{SiO}_2$  gate oxide interface (see Fig. 7, as well as column 4, lines 18-19, and column 5, lines 10-11, and Chan et al. (United States Patent 5,801,396, already of record), which discloses: "SiGe alloys at low Ge concentrations provide grown oxides which are reasonably close in quality to those grown on pure Si" (column 7, lines 16-18), and note that Selvakumar et al.'s SiGe channel region has a low (16%) Ge concentration); and wherein the  $\text{Si}_{1-x}\text{Ge}_x$  channel region is formed from ion implanting germanium (Ge) into the substrate at a dose of approximately  $2 \times 10^{16}$  atoms/cm<sup>2</sup>, and wherein Ge is implanted at an energy of approximately 20 to 100 keV.

Thus, although claim 25's transistor is formed by a different process than Selvakumar et al.'s transistor (i.e., claim 25's SiGe channel region is formed by implanting germanium into the silicon substrate after the  $\text{SiO}_2$  gate oxide is formed

while Selvakumar et al's SiGe channel region is formed by implanting germanium into the silicon substrate before the SiO<sub>2</sub> gate oxide is formed), claim 25's transistor, including its "wherein the Si<sub>1-x</sub>Ge<sub>x</sub> channel region forms a continuous Si<sub>1-x</sub>Ge<sub>x</sub>/SiO<sub>2</sub> gate oxide interface wherein no germanium oxide is present at the Si<sub>1-x</sub>Ge<sub>x</sub>/SiO<sub>2</sub> gate oxide interface" limitation, is the same as or obvious over Selvakumar et al's transistor, as evidenced by both Selvakumar et al. (see Fig. 7, as well as column 4, lines 18-19, and column 5, lines 10-11) and Chan et al. (which discloses "SiGe alloys at low Ge concentrations provide grown oxides which are reasonably close in quality to those grown on pure Si" (column 7, lines 16-18)).

Accordingly, as per MPEP §2113, claim 25 is rejected under 35 U.S.C. §102(b) as anticipated by or, in the alternative, under 35 U.S.C. §103(a) as obvious over Selvakumar et al.

With respect to independent claim 28, Selvakumar et al. disclose a p-channel metal-oxide-semiconductor (MOS) transistor formed on a silicon substrate, comprising (see the entire patent, particularly column 1, line 51, and the Figs. 1-7 disclosure): a Si<sub>1-x</sub>Ge<sub>x</sub> channel region, having a germanium molar fraction of 0.2, and formed in the substrate, underneath a silicon dioxide (SiO<sub>2</sub>) gate oxide and between a source region and a drain region; wherein the Si<sub>1-x</sub>Ge<sub>x</sub> channel region forms a continuous Si<sub>1-x</sub>Ge<sub>x</sub>/SiO<sub>2</sub> gate oxide interface wherein no germanium oxide is present at the Si<sub>1-x</sub>Ge<sub>x</sub>/SiO<sub>2</sub> gate oxide interface (see Fig. 7, as well as column 4, lines 18-19, and column 5, lines 10-11). See also Chan et al. (United States Patent 5,801,396, already of record), which discloses: "SiGe alloys at low Ge concentrations provide grown oxides which are reasonably close in quality to those grown on pure Si" (column 7, lines 16-18), and note that Selvakumar et al's SiGe channel region has a low (about

16%) Ge concentration.

Thus, although claim 28's transistor is formed by a different process than Selvakumar et al's transistor (i.e., claim 28's SiGe channel region is formed by implanting germanium into the silicon substrate after the SiO<sub>2</sub> gate oxide is formed while Selvakumar et al's SiGe channel region is formed by implanting germanium into the silicon substrate before the SiO<sub>2</sub> gate oxide is formed), claim 28's transistor, including its "wherein the Si<sub>1-x</sub>Ge<sub>x</sub> channel region forms a continuous Si<sub>1-x</sub>Ge<sub>x</sub>/SiO<sub>2</sub> gate oxide interface wherein no germanium oxide is present at the Si<sub>1-x</sub>Ge<sub>x</sub>/SiO<sub>2</sub> gate oxide interface" limitation, is the same as or obvious over Selvakumar et al's transistor, as evidenced by both Selvakumar et al. (see Fig. 7, as well as column 4, lines 18-19, and column 5, lines 10-11) and Chan et al. (which discloses "SiGe alloys at low Ge concentrations provide grown oxides which are reasonably close in quality to those grown on pure Si" (column 7, lines 16-18)).

Accordingly, as per MPEP §2113, claim 28 is rejected under 35 U.S.C. §102(b) as anticipated by or, in the alternative, under 35 U.S.C. §103(a) as obvious over Selvakumar et al.

With respect to dependent device claim 32, the process recited therein is not determinative of its patentability. Again, see MPEP §2113.

Claim 32 is thus rejected under 35 U.S.C. §102(b) as anticipated by or, in the alternative, under 35 U.S.C. §103(a) as obvious over Selvakumar et al.

With respect to independent claim 38, Selvakumar et al. disclose a semiconductor transistor, comprising (see the entire patent, particularly col. 1, line 51, and the Figs. 1-7 disclosure): a silicon substrate; a silicon dioxide (SiO<sub>2</sub>) gate oxide, coupled to the substrate; a gate, coupled to the SiO<sub>2</sub> gate oxide; source/drain regions

formed in the substrate on opposite sides of the gate; and a  $\text{Si}_{1-x}\text{Ge}_x$  channel region, having a germanium molar fraction of  $x$ , located underneath the  $\text{SiO}_2$  gate oxide and between the source/drain regions, wherein  $x$  is less than or equal to 0.6, and wherein the  $\text{Si}_{1-x}\text{Ge}_x$  channel region forms a continuous  $\text{Si}_{1-x}\text{Ge}_x/\text{SiO}_2$  gate oxide interface wherein no germanium oxide is present at the  $\text{Si}_{1-x}\text{Ge}_x/\text{SiO}_2$  gate oxide interface (see Fig. 7, as well as column 4, lines 18-19, and column 5, lines 10-11). See also Chan et al. (United States Patent 5,801,396, already of record), which discloses: "SiGe alloys at low Ge concentrations provide grown oxides which are reasonably close in quality to those grown on pure Si" (column 7, lines 16-18), and note that Selvakumar et al's SiGe channel region has a low (about 16%) Ge concentration.

Thus, although claim 38's transistor is formed by a different process than Selvakumar et al's transistor (i.e., claim 38's SiGe channel region is formed by implanting germanium into the silicon substrate after the  $\text{SiO}_2$  gate oxide is formed while Selvakumar et al's SiGe channel region is formed by implanting germanium into the silicon substrate before the  $\text{SiO}_2$  gate oxide is formed), claim 38's transistor, including its "wherein the  $\text{Si}_{1-x}\text{Ge}_x$  channel region forms a continuous  $\text{Si}_{1-x}\text{Ge}_x/\text{SiO}_2$  gate oxide interface wherein no germanium oxide is present at the  $\text{Si}_{1-x}\text{Ge}_x/\text{SiO}_2$  gate oxide interface" limitation, is the same as or obvious over Selvakumar et al's transistor, as evidenced by both Selvakumar et al. (see Fig. 7, as well as column 4, lines 18-19, and column 5, lines 10-11) and Chan et al. (which discloses "SiGe alloys at low Ge concentrations provide grown oxides which are reasonably close in quality to those grown on pure Si" (column 7, lines 16-18)).

Accordingly, as per MPEP §2113, claim 38 is rejected under 35 U.S.C. §102(b) as anticipated by or, in the alternative, under 35 U.S.C. §103(a) as obvious over

Selvakumar et al.

With respect to independent claim 40, Selvakumar et al. disclose a semiconductor transistor formed on a silicon substrate, comprising (see the entire patent, particularly column 1, line 51, and the Figs. 1-7 disclosure): a  $\text{Si}_{1-x}\text{Ge}_x$  channel region, having a germanium molar fraction of 0.2 formed in the substrate, underneath a silicon dioxide ( $\text{SiO}_2$ ) gate oxide and between a source region and a drain region; wherein the  $\text{Si}_{1-x}\text{Ge}_x$  channel region forms a continuous  $\text{Si}_{1-x}\text{Ge}_x/\text{SiO}_2$  gate oxide interface wherein no germanium oxide is present at the  $\text{Si}_{1-x}\text{Ge}_x/\text{SiO}_2$  gate oxide interface (see Fig. 7, as well as column 4, lines 18-19, and column 5, lines 10-11). See also Chan et al. (United States Patent 5,801,396, already of record), which discloses: "SiGe alloys at low Ge concentrations provide grown oxides which are reasonably close in quality to those grown on pure Si" (column 7, lines 16-18), and note that Selvakumar et al's SiGe channel region has a low (about 16%) Ge concentration.

Thus, although claim 40's transistor is formed by a different process than Selvakumar et al's transistor (i.e., claim 40's SiGe channel region is formed by implanting germanium into the silicon substrate after the  $\text{SiO}_2$  gate oxide is formed while Selvakumar et al's SiGe channel region is formed by implanting germanium into the silicon substrate before the  $\text{SiO}_2$  gate oxide is formed), claim 40's transistor, including its "wherein the  $\text{Si}_{1-x}\text{Ge}_x$  channel region forms a continuous  $\text{Si}_{1-x}\text{Ge}_x/\text{SiO}_2$  gate oxide interface wherein no germanium oxide is present at the  $\text{Si}_{1-x}\text{Ge}_x/\text{SiO}_2$  gate oxide interface" limitation, is the same as or obvious over Selvakumar et al's transistor, as evidenced by both Selvakumar et al. (see Fig. 7, as well as column 4, lines 18-19, and column 5, lines 10-11) and Chan et al. (which discloses "SiGe alloys at low Ge

concentrations provide grown oxides which are reasonably close in quality to those grown on pure Si" (column 7, lines 16-18)).

Accordingly, as per MPEP §2113, claim 40 is rejected under 35 U.S.C. §102(b) as anticipated by or, in the alternative, under 35 U.S.C. §103(a) as obvious over Selvakumar et al.

With respect to independent claim 41, Selvakumar et al. disclose a semiconductor transistor formed on a silicon substrate, comprising (see the entire patent, particularly column 1, line 51, and the Figs. 1-7 disclosure): a  $\text{Si}_{1-x}\text{Ge}_x$  channel region, having a germanium molar fraction of  $x$ , and formed in the substrate, underneath a silicon dioxide ( $\text{SiO}_2$ ) gate oxide and between a source region and a drain region; wherein  $x$  is less than or equal to 0.6, and wherein the  $\text{Si}_{1-x}\text{Ge}_x$  channel region forms a continuous  $\text{Si}_{1-x}\text{Ge}_x/\text{SiO}_2$  gate oxide interface wherein no germanium oxide is present at the  $\text{Si}_{1-x}\text{Ge}_x/\text{SiO}_2$  gate oxide interface (see Fig. 7, as well as column 4, lines 18-19, and column 5, lines 10-11, and Chan et al. (United States Patent 5,801,396, already of record), which discloses: "SiGe alloys at low Ge concentrations provide grown oxides which are reasonably close in quality to those grown on pure Si" (column 7, lines 16-18), and note that Selvakumar et al's SiGe channel region has a low (16%) Ge concentration), and wherein the Ge is implanted at an energy of approximately 20 to 100 keV.

Thus, although claim 41's transistor is formed by a different process than Selvakumar et al's transistor (i.e., claim 41's SiGe channel region is formed by implanting germanium into the silicon substrate after the  $\text{SiO}_2$  gate oxide is formed while Selvakumar et al's SiGe channel region is formed by implanting germanium into the silicon substrate before the  $\text{SiO}_2$  gate oxide is formed), claim 41's transistor,

including its “wherein the Si<sub>1-x</sub>Ge<sub>x</sub> channel region forms a continuous Si<sub>1-x</sub>Ge<sub>x</sub>/SiO<sub>2</sub> gate oxide interface wherein no germanium oxide is present at the Si<sub>1-x</sub>Ge<sub>x</sub>/SiO<sub>2</sub> gate oxide interface” limitation, is the same as or obvious over Selvakumar et al’s transistor, as evidenced by both Selvakumar et al. (see Fig. 7, as well as column 4, lines 18-19, and column 5, lines 10-11) and Chan et al. (which discloses “SiGe alloys at low Ge concentrations provide grown oxides which are reasonably close in quality to those grown on pure Si” (column 7, lines 16-18)).

Accordingly, as per MPEP §2113, claim 41 is rejected under 35 U.S.C. §102(b) as anticipated by or, in the alternative, under 35 U.S.C. §103(a) as obvious over Selvakumar et al.

Claims 13, 26, 27, 39, 42 and 43 are rejected under 35 U.S.C. §103(a) as being unpatentable over Selvakumar et al. (United States Patent 5,426,069, already of record) together with Crabbe’ et al. (United States Patent 5,821,577, already of record).

Specifically, the structural difference between Selvakumar et al’s transistor (see the entire patent, particularly column 1, line 51, and the Figs. 1-7 disclosure) and the transistor recited in dependent claims 13, 26, 27, 39, 42 and 43 is the former’s SiGe channel thickness is unknown, while the latter’s SiGe channel thickness is “approximately 100 to 1,000 angstroms” (claims 13, 26, 39 and 42) or “approximately 300 angstroms” (claims 27 and 43).

Crabbe’ et al. disclose forming SiGe channels 100 to 500 angstroms thick (see column 6, lines 17-22).

It would have been obvious to one skilled in this art to make Selvakumar et al’s SiGe channel of undisclosed thickness 100 to 500 angstroms thick, as suggested by

Crabbe' et al.

Claims 13, 26, 27, 39, 42 and 43 are thus rejected under 35 U.S.C. §103(a) as being unpatentable over Selvakumar et al. together with Crabbe' et al.

Product-by-process claims 11, 14, 24, 25, 28, 32, 38, 40 and 41 are rejected under 35 U.S.C. §102(b) as anticipated by or, in the alternative, under 35 U.S.C. §103(a) as obvious over Nakagawa (United States Patent 5,272,365, already of record). Note MPEP §2113.

With respect to independent claim 11, Nakagawa discloses a p-channel metal-oxide-semiconductor (MOS) transistor, comprising (see the entire patent, particularly the Fig. 3 disclosure): a silicon substrate 12; a silicon dioxide ( $\text{SiO}_2$ ) gate oxide "34" (such should be 18, as per Figs. 1-2), coupled to the substrate; a gate 22, coupled to the  $\text{SiO}_2$  gate oxide; source/drain regions 14/16 formed in the substrate on opposite sides of the gate; and a  $\text{Si}_{1-x}\text{Ge}_x$  channel region 42, having a germanium molar fraction  $x$ , located underneath the  $\text{SiO}_2$  gate oxide and between the source/drain regions, wherein  $x$  is less than or equal to 0.6, and wherein the  $\text{Si}_{1-x}\text{Ge}_x$  channel region forms a continuous  $\text{Si}_{1-x}\text{Ge}_x/\text{SiO}_2$  gate oxide interface wherein no germanium oxide is present at the  $\text{Si}_{1-x}\text{Ge}_x/\text{SiO}_2$  gate oxide interface (see column 5, lines 19-30). See also Chan et al. (United States Patent 5,801,396, already of record), which discloses: "SiGe alloys at low Ge concentrations provide grown oxides which are reasonably close in quality to those grown on pure Si" (column 7, lines 16-18), and note that Nakagawa's SiGe channel region has a low ( $\leq 30\%$ ) Ge concentration.

Thus, although claim 11's transistor is formed by a different process than Nakagawa's transistor (i.e., claim 11's SiGe channel region is formed by implanting germanium into the silicon substrate after the  $\text{SiO}_2$  gate oxide is formed while

Nakagawa's SiGe channel region is formed by implanting germanium into the silicon substrate before the SiO<sub>2</sub> gate oxide is formed), claim 11's transistor, including its "wherein the Si<sub>1-x</sub>Ge<sub>x</sub> channel region forms a continuous Si<sub>1-x</sub>Ge<sub>x</sub>/SiO<sub>2</sub> gate oxide interface wherein no germanium oxide is present at the Si<sub>1-x</sub>Ge<sub>x</sub>/SiO<sub>2</sub> gate oxide interface" limitation, is the same as or obvious over Nakagawa's transistor, as evidenced by both Nakagawa (see column 5, lines 19-30) and Chan et al. (which discloses "SiGe alloys at low Ge concentrations provide grown oxides which are reasonably close in quality to those grown on pure Si" (column 7, lines 16-18)).

Accordingly, as per MPEP §2113, claim 11 is rejected under 35 U.S.C. §102(b) as anticipated by or, in the alternative, under 35 U.S.C. §103(a) as obvious over Nakagawa.

With respect to dependent claim 14, Nakagawa's germanium molar fraction is approximately 0.2. See column 3, lines 21-25.

Claim 14 is thus rejected under 35 U.S.C. §102(b) as anticipated by or, in the alternative, under 35 U.S.C. §103(a) as obvious over Nakagawa.

With respect to independent claim 24, Nakagawa discloses a p-channel metal-oxide-semiconductor (MOS) transistor formed on a silicon substrate, comprising (see the entire patent, particularly the Fig. 3 disclosure): a Si<sub>1-x</sub>Ge<sub>x</sub> channel region 42, having a germanium molar fraction of x, and formed in the substrate 12, underneath a silicon dioxide (SiO<sub>2</sub>) gate oxide "34" (such should be 18, as per Figs. 1-2) and between a source region 14 and a drain region 16; wherein x is less than or equal to 0.6, and wherein the Si<sub>1-x</sub>Ge<sub>x</sub> channel region forms a continuous Si<sub>1-x</sub>Ge<sub>x</sub>/SiO<sub>2</sub> gate oxide interface wherein no germanium oxide is present at the Si<sub>1-x</sub>Ge<sub>x</sub>/SiO<sub>2</sub> gate oxide interface (see column 5, lines 19-30). See also Chan et al. (United States

Patent 5,801,396, already of record), which discloses: "SiGe alloys at low Ge concentrations provide grown oxides which are reasonably close in quality to those grown on pure Si" (column 7, lines 16-18), and note that Nakagawa's SiGe channel region has a low ( $\leq 30\%$ ) Ge concentration.

Thus, although claim 24's transistor is formed by a different process than Nakagawa's transistor (i.e., claim 24's SiGe channel region is formed by implanting germanium into the silicon substrate after the SiO<sub>2</sub> gate oxide is formed while Nakagawa's SiGe channel region is formed by implanting germanium into the silicon substrate before the SiO<sub>2</sub> gate oxide is formed), claim 24's transistor, including its "wherein the Si<sub>1-x</sub>Ge<sub>x</sub> channel region forms a continuous Si<sub>1-x</sub>Ge<sub>x</sub>/SiO<sub>2</sub> gate oxide interface wherein no germanium oxide is present at the Si<sub>1-x</sub>Ge<sub>x</sub>/SiO<sub>2</sub> gate oxide interface" limitation, is the same as or obvious over Nakagawa's transistor, as evidenced by both Nakagawa (see column 5, lines 19-30) and Chan et al. (which discloses "SiGe alloys at low Ge concentrations provide grown oxides which are reasonably close in quality to those grown on pure Si" (column 7, lines 16-18)).

Accordingly, as per MPEP §2113, claim 24 is rejected under 35 U.S.C. §102(b) as anticipated by or, in the alternative, under 35 U.S.C. §103(a) as obvious over Nakagawa.

With respect to independent claim 25, Nakagawa discloses a p-channel metal-oxide-semiconductor (MOS) transistor formed on a silicon substrate, comprising (see the entire patent, particularly the Fig. 3 disclosure): a Si<sub>1-x</sub>Ge<sub>x</sub> channel region 42, having a germanium molar fraction of x, and formed in the substrate 12, underneath a silicon dioxide (SiO<sub>2</sub>) gate oxide "34" (such should be 18, as per Figs. 1-2) and between a source region 14 and a drain region 16; wherein x is less than or equal to

0.6, and wherein the  $\text{Si}_{1-x}\text{Ge}_x$  channel region forms a continuous  $\text{Si}_{1-x}\text{Ge}_x/\text{SiO}_2$  gate oxide interface wherein no germanium oxide is present at the  $\text{Si}_{1-x}\text{Ge}_x/\text{SiO}_2$  gate oxide interface (see column 5, lines 19-30, and Chan et al. (United States Patent 5,801,396, already of record), which discloses: "SiGe alloys at low Ge concentrations provide grown oxides which are reasonably close in quality to those grown on pure Si" (column 7, lines 16-18), and note that Nakagawa's SiGe channel region has a low ( $\leq 30\%$ ) Ge concentration); and wherein the  $\text{Si}_{1-x}\text{Ge}_x$  channel region is formed from ion implanting germanium (Ge) into the substrate.

Thus, although claim 25's transistor is formed by a different process than Nakagawa's transistor (i.e., claim 25's SiGe channel region is formed by implanting germanium into the silicon substrate after the  $\text{SiO}_2$  gate oxide is formed while Nakagawa's SiGe channel region is formed by implanting germanium into the silicon substrate before the  $\text{SiO}_2$  gate oxide is formed), claim 25's transistor, including its "wherein the  $\text{Si}_{1-x}\text{Ge}_x$  channel region forms a continuous  $\text{Si}_{1-x}\text{Ge}_x/\text{SiO}_2$  gate oxide interface wherein no germanium oxide is present at the  $\text{Si}_{1-x}\text{Ge}_x/\text{SiO}_2$  gate oxide interface" limitation, is the same as or obvious over Nakagawa's transistor, as evidenced by both Nakagawa (see column 5, lines 19-30) and Chan et al. (which discloses "SiGe alloys at low Ge concentrations provide grown oxides which are reasonably close in quality to those grown on pure Si" (column 7, lines 16-18)).

Accordingly, as per MPEP §2113, claim 25 is rejected under 35 U.S.C. §102(b) as anticipated by or, in the alternative, under 35 U.S.C. §103(a) as obvious over Nakagawa.

With respect to independent claim 28, Nakagawa discloses a p-channel metal-oxide-semiconductor (MOS) transistor formed on a silicon substrate, comprising (see

the entire patent, particularly the Fig. 3 disclosure): a  $\text{Si}_{1-x}\text{Ge}_x$  channel region 42, having a germanium molar fraction of 0.2, and formed in the substrate 12, underneath a silicon dioxide ( $\text{SiO}_2$ ) gate oxide "34" (such should be 18, as per Figs. 1-2) and between a source region 14 and a drain region 16; wherein the  $\text{Si}_{1-x}\text{Ge}_x$  channel region forms a continuous  $\text{Si}_{1-x}\text{Ge}_x/\text{SiO}_2$  gate oxide interface wherein no germanium oxide is present at the  $\text{Si}_{1-x}\text{Ge}_x/\text{SiO}_2$  gate oxide interface (see column 5, lines 19-30). See also Chan et al. (United States Patent 5,801,396, already of record), which discloses: "SiGe alloys at low Ge concentrations provide grown oxides which are reasonably close in quality to those grown on pure Si" (column 7, lines 16-18), and note that Nakagawa's SiGe channel region has a low ( $\leq 30\%$ ) Ge concentration.

Thus, although claim 28's transistor is formed by a different process than Nakagawa's transistor (i.e., claim 28's SiGe channel region is formed by implanting germanium into the silicon substrate after the  $\text{SiO}_2$  gate oxide is formed while Nakagawa's SiGe channel region is formed by implanting germanium into the silicon substrate before the  $\text{SiO}_2$  gate oxide is formed), claim 28's transistor, including its "wherein the  $\text{Si}_{1-x}\text{Ge}_x$  channel region forms a continuous  $\text{Si}_{1-x}\text{Ge}_x/\text{SiO}_2$  gate oxide interface wherein no germanium oxide is present at the  $\text{Si}_{1-x}\text{Ge}_x/\text{SiO}_2$  gate oxide interface" limitation, is the same as or obvious over Nakagawa's transistor, as evidenced by both Nakagawa (see column 5, lines 19-30) and Chan et al. (which discloses "SiGe alloys at low Ge concentrations provide grown oxides which are reasonably close in quality to those grown on pure Si" (column 7, lines 16-18)).

Accordingly, as per MPEP §2113, claim 28 is rejected under 35 U.S.C. §102(b) as anticipated by or, in the alternative, under 35 U.S.C. §103(a) as obvious over Nakagawa.

With respect to dependent device claim 32, the process recited therein is not determinative of its patentability. Again, see MPEP §2113.

Claim 32 is thus rejected under 35 U.S.C. §102(b) as anticipated by or, in the alternative, under 35 U.S.C. §103(a) as obvious over Nakagawa.

With respect to independent claim 38, Nakagawa discloses a semiconductor transistor, comprising (see the entire patent, particularly the Fig. 3 disclosure): a silicon substrate 12; a silicon dioxide ( $\text{SiO}_2$ ) gate oxide "34" (such should be 18, as per Figs. 1-2), coupled to the substrate 12; a gate 22, coupled to the  $\text{SiO}_2$  gate oxide; source/drain regions 14/16 formed in the substrate on opposite sides of the gate; and a  $\text{Si}_{1-x}\text{Ge}_x$  channel region 42, having a germanium molar fraction of  $x$ , located underneath the  $\text{SiO}_2$  gate oxide and between the source/drain regions, wherein  $x$  is less than or equal to 0.6, and wherein the  $\text{Si}_{1-x}\text{Ge}_x$  channel region forms a continuous  $\text{Si}_{1-x}\text{Ge}_x/\text{SiO}_2$  gate oxide interface wherein no germanium oxide is present at the  $\text{Si}_{1-x}\text{Ge}_x/\text{SiO}_2$  gate oxide interface (see column 5, lines 19-30). See also Chan et al. (United States Patent 5,801,396, already of record), which discloses: "SiGe alloys at low Ge concentrations provide grown oxides which are reasonably close in quality to those grown on pure Si" (column 7, lines 16-18), and note that Nakagawa's SiGe channel region has a low ( $\leq 30\%$ ) Ge concentration.

Thus, although claim 38's transistor is formed by a different process than Nakagawa's transistor (i.e., claim 38's SiGe channel region is formed by implanting germanium into the silicon substrate after the  $\text{SiO}_2$  gate oxide is formed while Nakagawa's SiGe channel region is formed by implanting germanium into the silicon substrate before the  $\text{SiO}_2$  gate oxide is formed), claim 38's transistor, including its "wherein the  $\text{Si}_{1-x}\text{Ge}_x$  channel region forms a continuous  $\text{Si}_{1-x}\text{Ge}_x/\text{SiO}_2$  gate oxide

interface wherein no germanium oxide is present at the Si<sub>1-x</sub>Ge<sub>x</sub>/SiO<sub>2</sub> gate oxide interface” limitation, is the same as or obvious over Nakagawa’s transistor, as evidenced by both Nakagawa (see column 5, lines 19-30) and Chan et al. (which discloses “SiGe alloys at low Ge concentrations provide grown oxides which are reasonably close in quality to those grown on pure Si” (column 7, lines 16-18)).

Accordingly, as per MPEP §2113, claim 38 is rejected under 35 U.S.C. §102(b) as anticipated by or, in the alternative, under 35 U.S.C. §103(a) as obvious over Nakagawa.

With respect to independent claim 40, Nakagawa discloses a semiconductor transistor formed on a silicon substrate, comprising (see the entire patent, particularly the Fig. 3 disclosure): a Si<sub>1-x</sub>Ge<sub>x</sub> channel region 42, having a germanium molar fraction of 0.2 formed in the substrate 12, underneath a silicon dioxide (SiO<sub>2</sub>) gate oxide “34” (such should be 18, as per Figs. 1-2) and between a source region 14 and a drain region 16; wherein the Si<sub>1-x</sub>Ge<sub>x</sub> channel region forms a continuous Si<sub>1-x</sub>Ge<sub>x</sub>/SiO<sub>2</sub> gate oxide interface wherein no germanium oxide is present at the Si<sub>1-x</sub>Ge<sub>x</sub>/SiO<sub>2</sub> gate oxide interface (see column 5, lines 19-30). See also Chan et al. (United States Patent 5,801,396, already of record), which discloses: “SiGe alloys at low Ge concentrations provide grown oxides which are reasonably close in quality to those grown on pure Si” (column 7, lines 16-18), and note that Nakagawa’s SiGe channel region has a low ( $\leq 30\%$ ) Ge concentration.

Thus, although claim 40’s transistor is formed by a different process than Nakagawa’s transistor (i.e., claim 40’s SiGe channel region is formed by implanting germanium into the silicon substrate after the SiO<sub>2</sub> gate oxide is formed while Nakagawa’s SiGe channel region is formed by implanting germanium into the silicon

substrate before the SiO<sub>2</sub> gate oxide is formed), claim 40's transistor, including its "wherein the Si<sub>1-x</sub>Ge<sub>x</sub> channel region forms a continuous Si<sub>1-x</sub>Ge<sub>x</sub>/SiO<sub>2</sub> gate oxide interface wherein no germanium oxide is present at the Si<sub>1-x</sub>Ge<sub>x</sub>/SiO<sub>2</sub> gate oxide interface" limitation, is the same as or obvious over Nakagawa's transistor, as evidenced by both Nakagawa (see column 5, lines 19-30) and Chan et al. (which discloses "SiGe alloys at low Ge concentrations provide grown oxides which are reasonably close in quality to those grown on pure Si" (column 7, lines 16-18)).

Accordingly, as per MPEP §2113, claim 40 is rejected under 35 U.S.C. §102(b) as anticipated by or, in the alternative, under 35 U.S.C. §103(a) as obvious over Nakagawa.

With respect to independent claim 41, Nakagawa discloses a semiconductor transistor formed on a silicon substrate, comprising (see the entire patent, particularly the Fig. 3 disclosure): a Si<sub>1-x</sub>Ge<sub>x</sub> channel region 42, having a germanium molar fraction of x, and formed in the substrate 12, underneath a silicon dioxide (SiO<sub>2</sub>) gate oxide "34" (such should be 18, as per Figs. 1-2) and between a source region 14 and a drain region 16; wherein x is less than or equal to 0.6, and wherein the Si<sub>1-x</sub>Ge<sub>x</sub> channel region forms a continuous Si<sub>1-x</sub>Ge<sub>x</sub>/SiO<sub>2</sub> gate oxide interface wherein no germanium oxide is present at the Si<sub>1-x</sub>Ge<sub>x</sub>/SiO<sub>2</sub> gate oxide interface (see column 5, lines 19-30, and Chan et al. (United States Patent 5,801,396, already of record), which discloses: "SiGe alloys at low Ge concentrations provide grown oxides which are reasonably close in quality to those grown on pure Si" (column 7, lines 16-18), and note that Nakagawa's SiGe channel region has a low ( $\leq 30\%$ ) Ge concentration); and wherein the Si<sub>1-x</sub>Ge<sub>x</sub> channel region is formed from ion implanting germanium (Ge) into the substrate.

Thus, although claim 41's transistor is formed by a different process than Nakagawa's transistor (i.e., claim 41's SiGe channel region is formed by implanting germanium into the silicon substrate after the SiO<sub>2</sub> gate oxide is formed while Nakagawa's SiGe channel region is formed by implanting germanium into the silicon substrate before the SiO<sub>2</sub> gate oxide is formed), claim 41's transistor, including its "wherein the Si<sub>1-x</sub>Ge<sub>x</sub> channel region forms a continuous Si<sub>1-x</sub>Ge<sub>x</sub>/SiO<sub>2</sub> gate oxide interface wherein no germanium oxide is present at the Si<sub>1-x</sub>Ge<sub>x</sub>/SiO<sub>2</sub> gate oxide interface" limitation, is the same as or obvious over Nakagawa's transistor, as evidenced by both Nakagawa (see column 5, lines 19-30) and Chan et al. (which discloses "SiGe alloys at low Ge concentrations provide grown oxides which are reasonably close in quality to those grown on pure Si" (column 7, lines 16-18)).

Accordingly, as per MPEP §2113, claim 41 is rejected under 35 U.S.C. §102(b) as anticipated by or, in the alternative, under 35 U.S.C. §103(a) as obvious over Nakagawa.

Claims 13, 26, 27, 39, 42 and 43 are rejected under 35 U.S.C. §103(a) as being unpatentable over Nakagawa (United States Patent 5,272,365, already of record) together with Crabbe' et al. (United States Patent 5,821,577, already of record).

Specifically, the structural difference between Nakagawa's transistor (see the entire patent, particularly the Fig. 3 disclosure) and the transistor recited in dependent claims 13, 26, 27, 39, 42 and 43 is the former's SiGe channel thickness is unknown, while the latter's SiGe channel thickness is "approximately 100 to 1,000 angstroms" (claims 13, 26, 39 and 42) or "approximately 300 angstroms" (claims 27 and 43).

Crabbe' et al. disclose forming SiGe channels 100 to 500 angstroms thick (see column 6, lines 17-22).

It would have been obvious to one skilled in this art to make Nakagawa's SiGe channel 42 of undisclosed thickness 100 to 500 angstroms thick, as suggested by Crabbe' et al.

Claims 13, 26, 27, 39, 42 and 43 are thus rejected under 35 U.S.C. §103(a) as being unpatentable over Nakagawa together with Crabbe' et al.

The applicant's arguments are without merit.

First, the applicant has failed to meet the burden clearly set forth in the Office Action mailed January 9, 2003 (i.e., its burden to come forward with **evidence** establishing an unobvious difference between the claimed product and the prior art products, as per MPEP §2113). Again, **mere attorney argument cannot take the place of evidence**. See *In re DeBlauwe*, 736 F.2d 699, 222 USPQ 191 (Fed. Cir. 1984).

More specifically, the applicant has failed to provide any evidence to support its allegation that there is an unobvious difference between the claimed product and the prior art (Selvakumar et al. and Nakagawa) products.

Still more specifically, the applicant has failed to provide any evidence to support its allegation that there is an unobvious difference between the claimed product and the prior art (Selvakumar et al. and Nakagawa) products as a result of their being formed by different processes (the claimed product is formed by ion implanting germanium into a channel region after forming the gate oxide while the prior art products are formed by ion implanting germanium into the channel region before forming the gate oxide).

Finally, the applicant has apparently failed to appreciate the Chan et al. evidence cited by the examiner in support of the §102/§103 rejections. Specifically,

Chan et al. discloses: "SiGe alloys at low Ge concentrations provide grown oxides which are reasonably close in quality to those grown on pure Si" (col. 7, lines 16-18).

The applicant's citation of Chan et al's "inverted design" disclosure (see the response at page 8, first paragraph) is misplaced, because Chan et al. discloses using such primarily for SiGe alloys "with higher Ge percentages" (column 7, lines 18-25).

Tsutsu (United States Patent 6,118,151) is relevant to this application.
